

**Service description for Internet Single Access Basic 2 Mbit/s dedicated:**

Access to the Internet is provided over a high-speed data network (gigabit network) available at Messe Wien and a high-performance, redundant connection to two different providers.

With Internet "Single Access Basic 2 Mbit/s dedicated" you receive an Internet connection with a bandwidth of 2 Mbit/s in both directions, private IP address allocation via DHCP, fair use download volume and login with a username and password provided by us in advance.

Provision of this service at the booth takes place via a shielded CAT-5 data cable with standard RJ45 plug.

Included is the infrastructure, availability check for the connections, planning and laying of the line in coordination with the booth builder or, if necessary, with the trade fair operator, functional check after completion as well as a technical hotline during the event and during the set-up and break-down times.

Setup: Connect the LAN cable at the fair booth to the network port of the computer, start an Internet browser (in the Internet settings, DHCP should be configured and the proxy deactivated), open any page (e.g. [www.kapsch.net](http://www.kapsch.net)) and you will arrive at the login page, enter your username and password and surf away.
