

**Service description for customised patched LAN connectivity:**

The existing high-speed data network (gigabit network) at Messe Wien allows line connections between any two points at the venue (including between halls). VLAN configurations can also be realized for multiple VLANs.

Provision of this service at the booth takes place via a shielded CAT-5 data cable with standard RJ45 plug.

Included is the infrastructure, availability check for the connections, planning and laying of the line in coordination with the booth builder or, if necessary, with the trade fair operator, functional check after completion as well as a technical hotline during the event and during the set-up and break-down times.
